INTERSTITIAL & INTRA-ARTICULAR LASER THERAPY

TARGETED DELIVERY

Using a sterile catheter, we can now direct energy precisely to the symptomatic area, ensuring:

- Marked reduction in pain intensity, even in chronic, treatment-resistant conditions.
- Sustainable regeneration of the affected area.

DEEP PENETRATION

Our lasers can now penetrate up to 12 cm into tissue. This advancement allows even green and blue lasers, which are typically absorbed on the tissue surface, to work deep within, offering anti-inflammatory effects.

INTRAVENOUS LASER THERAPY

By placing laser light directly into the bloodstream using a unique catheter, we tap into a method that has seen over 30 years of success. Various tests have shown the myriad positive effects of low-intensity laser stimulation on blood cells.
